

Bloom GPT-2-small Layer-6 Residual SAE (published), evaluated on uninjected residual activations (no retraining)

encoder-label cosine

Low C_{resid} and high encoder-label alignment can coexist.

Covariance and independence power are not determined by C_{resid} alone.

Several atoms have near-maximal C_{resid} but heterogeneous covariance power and zero independence power.

Each point is an atom (nine scored). 3-cell strip = detector power at $N = 1024$ [Label / Covariance / Independence].

- Bloom GPT-2-small residual SAE, layer 6; uninjected residual activations; no retraining.
- Encoder-label cosine is an alignment measure to an external label direction; it is not a ground-truth label identity.
- Residual coordinate 447 is reported only as a dominant coordinate / occupancy cue, not as a semantic concept.

- This is not a broad SAE quality comparison and does not claim named-concept discovery.
- Near-duplicate atoms 23123 and 316 are identified in the residual-coordinate sense (low C_{32}); no semantic implication is intended.
